

Do you capture  
all your contrast  
revenue?

# A Common Error

- Coding errors can cause a facility to experience a **10–30%** decrease in revenue (Journal of the American Medical Informatics Association)
- Inaccurate coding, specifically for missed contrast is a top revenue draining error in radiology billing

## Ask Yourself...

Are my technologists properly trained to adjust a study if adding contrast comes in later?

How frequently is contrast not accurate in a study or series label and the coding is inaccurate because of it?

How much revenue has my facility lost because of missed contrast revenue?

# Data Standardization

- The use of CV within our advanced technology scans the image and ensures contrast appears in the labels when contrast is used.
- Labels account for contrast, laterality, and have complete and accurate descriptions.

The billing code for this study does not include contrast administered.
